

Health Protect – security

ensuring the privacy and integrity of patient information

establish a robust perimeter defence

Interoperable electronic health records, interdisciplinary healthcare teams and the increasing use of information technology within the healthcare system present new challenges and opportunities. It is critical to reach an appropriate balance among privacy, information management and real-time accessibility of information for quality patient care and safety.

End-to-end security management achieves this balance. Our certified staff will help you formulate policies and standards, install, configure, maintain and manage a comprehensive leading-edge security strategy, driven by clinician practice needs. It is built on protocols and permissions designed by your healthcare organization, and includes monitoring the authorization of users on the network, providing secure communication to the wider healthcare community, and blocking outside threats such as intruders, viruses and denial-of-service attacks.

the ultimate in protection

The more your organization relies on data networks and the Internet for essential information relating to patient care, the more critical it is that you ensure the privacy and availability of that information. Patient safety can depend on it. Our approach allows you to keep costs under control, and maintain compliance with privacy and protection regulations. Our leading-edge security solutions address key operational issues:

Extend access to information securely. With the extension of communication networks to the wider healthcare community (pharmacists, laboratories, etc.), there is greater concern over the privacy of data. TELUS Managed Firewall, VPN and Secure Authentication solutions give your organization a first line of defence by assisting with the security of information traffic flowing into and out of your organization. Campuses, remote workers, suppliers and the wider healthcare community can all connect – as you dictate – without compromising security.

Support compliance with security standards. Healthcare organizations must comply with various security standards. TELUS Endpoint Security provides you with the highest level of security available. Our solutions not only ensure the security of your endpoints, they also allow you to implement governance control.

Assess your security strategy. TELUS Healthcare infrastructure solutions provide the building blocks to manage costs, increase access to quality care, and focus on the needs of patients.

TELUS Security solutions are part of the TELUS Health Protect solution family. With TELUS Health Protect, decision-makers can be confident that their information is secure, privacy-protected and readily available to authorized users.
